“MicroMacroMultilevel” in *R* (w/ Jackson G. Lu and Elizabeth Page-Gould)
 [Target: *Journal of Statistical Software*]

To date, most multilevel methodologies can only unbiasedly model macro-micro situations, wherein higher-level explanatory variables (e.g., aggregate-level variables) are used to predict an lower-level outcome variable (e.g., individual-level variables). In contrast, this R package enables researchers to unbiasedly model micro-macro situations, wherein individual-level explanatory variables (and group-level explanatory variables) are used to predict a group-level outcome variable. This package is useful because in micro-macro multilevel modeling, it is statistically biased to directly regress the group-level outcome variable on the unadjusted group means of individual-level explanatory variables (Croon & van Veldhoven, 2007). Instead, one should use the best linear unbiased predictors (BLUP) of the group means (i.e., the adjusted group means).
